Abstract
Synthesis a number of some new of Dihydrazones compounds through condensation of thiocarbohydrozid with substituted aromatic aldehyde by Microwave method. The Microwave methods were unique in being very fast with high yield. Experimental values of viscosity are presented for the mixtures of Dihydrazones compounds with water over the whole mole fraction range at 298.15, 308.15, 318.15 and 328.15 K. The data were used to calculate excess viscosity, ∆lnη. The results have been discussed in terms of the nature of solvent-solute interaction in the mixture. The microbial inhibitory effect of the new agents has been assessed in vitro against Gram-positive and Gram-negative bacteria activity. All Dihydrazones have been characterized by IR, 1H NMR, 13C NMR spectra.

Keywords: Dihydrazones, microwave irradiation, antibacterial activity, viscosity.

1. Introduction
Hydrazones contain two connected nitrogen atoms of different nature and a C-N double bond that is conjugated with a lone electron pair of the terminal nitrogen atom. These structure fragments are mainly responsible for the physical and chemical properties of hydrazones. Both nitrogen atoms of the hydrazone group are nucleophilic, although the amino type nitrogen is more reactive. The carbon atom of the hydrazone group has both electrophilic and nucleophilic character (1-6). Hydrazones are extensively studied as reactants or reaction intermediates since they can readily undergo various ring closure reactions. Among the benzothiazole derivatives, benzothiazol-2-ones and 2-mercaptobenzothiazoles have received considerable attention in organic chemistry associated with their importance in nucleophilic substitution reaction. The present study also confirmed that the ease of nucleophilic substitution depends on the nucleophilicity (8). Microwave technique is of wide application and global relevance in photo and electroluminescent polymers (9-11). The dynamic approach to combinatorial chemistry has recently been explored for both organic and inorganic molecular or supramolecular entities (11-14). Dihydrazones derivatives constitute an important class of functional groups for which divers biological properties such as antibacterial and antifungal, antidiabetic, cardiotoxic, anti-oedematus and antiviral activities (15-18).

2. Experimental
2.1 Instrumentation
Unless otherwise noted, materials were obtained from commercial suppliers and used without further purification. Water used in the present study in deionized and doubly distilled in specific conductivity was always below (1*10^-6 s.cm^-1), hydrazones derivatives. The water as determined by gas-liquid chromatography (Pye Unican Series loq) was less than 0.01 %. The uncertainty in the mole fraction was less than 2*10^-4. Melting points were recorded on electrothermal melting point apparatus. Thin layer chromatography (TLC) controls were carried out on precoated silica gel plates (F254 Merck). The IR spectra were recorded on Shimadzu 8400 FT-IR infrared spectrophotometer using KBr pellets. 1H NMR spectra were recorded on 1H NMR Bruken ultra shield 300 MHz. UV spectra were recorded on Shimadzu (uv-visible) spectrophotometer UV-1650PC. Ethanol (95%), scale (200-800) nm. 13C NMR spectra were recorded on 13C NMR. Viscosity was measured with a Schott-Genate viscometer AVS300. The flow time was measured electronically by two light barriers across the viscometer with a precision of ± 0.01 s. The calibration of the viscometer and the experimental data its are the same as given previously. The viscosities are accurate to 0.003 centipoise, in all measurements a Schott-Genate CT1150 thermostat was used a constant digital temperature control of ± 0.01 K at the desired temperature.

The equations:
The densities ρ, from a previous study (14) and the measured kinematics viscosity ν, in this work were used to calculate the absolute viscosity η. The obtained are listed in table (1) and plotted as a function of x, the mole fraction of hydrazones scheme 1. Excess viscosity γ, ∆ln η was calculated from the following equation:
\[ \Delta \eta = \eta_1 - x_1 \eta_1 + x_2 \eta_2 \]  

Where: \( \eta_1, \eta_2 \) and \( \eta \) represent the viscosity of pure hydrazone 1, 2, 3, 4, water and the mixture respectively. The obtained results are plotted in scheme 3.

2.2 Synthesis

2.2.1 Synthesis of Thiocarbohydrazide A.

5 ml of CS₂ was added gently to 20 ml of hydrazine hydrate (80%), was placed in round bottom flask under reflux for 30 min. Progress of reaction was monitored by TLC. After completion of reaction, the content was dumped in crushed ice and filtered. The product was recrystallized from ethanol to yield A. Yield 88%, m. p 171 °C.

2.2.2 Synthesis of Dihydrazone (1, 2, 3, 4, 5, 6)

Mix (0.001 mole) of thiocarbohydrazide (A) with (0.002 mole) from aromatic aldehyde or ketones, in round bottom flask and subjected to Microwave irradiation for (5-10) min. progress of reaction was monitored by TLC. After completion of reaction. The product was recrystallized from ethanol.

1. N', N''-bis[(E)-(4-methoxyphenyl)methylidene]thiocarbonohydrazide (1) Yield: 90%, m.p: 215-220 °C, IR (KBr, cm⁻¹): 3151, 3282, 1643, 1506-1600, 1228, 1026, 3002. \(^1\)H NMR (δ, ppm, DMSO-d₆): 7.74-6.8 (m, 8H, ArH), 8.49 (s, 1H, N=CH), 11.63 (s, 1H, NH), 9.9 (s, 1H, OH). \(^13\)C NMR (50MHz, δ, ppm, DMSO-d₆): 176-117 (C-Ar), 149 (C=N), 192 (S=C).

2. N', N''-bis[(E)-(4-chlorophenyl)methylidene]thiocarbonohydrazide (2) Yield: 90%, m.p: 198-200 °C, IR (KBr, cm⁻¹): 3198, 1602, 1594-1512, 1264, 1066, 3035, 2985, 652. \(^1\)H NMR (δ, ppm, DMSO-d₆): 7.05-8.4 (m, 8H, ArH), 8.93 (s, 1H, N=CH), 11.2 (s, 1H, NH). \(^13\)C NMR (50MHz, δ, ppm, DMSO-d₆): 119-149 (C-Ar), 138 (C=N), 168 (S=C).

3. N', N''-bis[(E)-(4-methoxyphenyl)methylidene]thiocarbonohydrazide (3) Yield: 87%, m.p: 210-212 °C, IR (KBr, cm⁻¹): 3320, 1600, 1529-1460, 1257, 1024, 3136, 2995. \(^1\)H NMR (δ, ppm, DMSO-d₆): 7.03-8.2 (m, 8H, ArH), 8.93 (s, 1H, N=CH), 11.7 (s, 1H, NH). \(^13\)C NMR (50MHz, δ, ppm, DMSO-d₆): 122-158 (C-Ar), 144 (C=N), 56 (2CH₃), 172 (S=C).

4. N', N''-bis[(E)-(phenyl)methylidene]thiocarbonohydrazide (4) Yield: 91%, m.p: 205-207 °C, IR (KBr, cm⁻¹): 3141, 1463-1587, 1240, 1022, 3058. \(^1\)H NMR (δ, ppm, DMSO-d₆): 6.68-7.53 (m, 8H, ArH), 8.74 (s, 1H, N=CH), 11.7 (s, 1H, NH). \(^13\)C NMR (50MHz, δ, ppm, DMSO-d₆): 115-160 (C-Ar), 144 (C=N), 185 (S=C).

Antimicrobial activity

The standardized disc-agar diffusion method (19) was followed to determine the activity of the synthesized compounds against the sensitive organisms staphylococcus aureus (ATCC 25932) and streptococcus pyogenes (ATCC 11615) as Gram-positive bacteria, Pseudomonas fluorescens (S 97) and Pseudomonas phuseoellica (GSPB 2828) as Gram-negative bacteria. The antibiotics chloramphenicol and cephalothin were used as standard reference incase of Gram-negative and Gram-positive bacteria, respectively. The tested compounds were dissolved in dimethylformamide (DMF) which have no inhibition activity to get concentrations of 2 mg/ml and 1 mg/ml. The test was performed on medium potato dextrose agar (PDA) which contain infusion of 200 g potatoes, 6 g dextrose and 5 g agar (20). Uniform size filter paper disks (3 disks per compound) were impregnated by equal volume (10 μl) from the specific concentration of dissolved tested compounds and carefully placed on inoculated agar surface. After incubation for 36 h at 27 °C, inhibition of the organism which evidenced by clear zone surround each mean of inhibition zones.

3. Results and discussion

3.1 Spectral characteristics

In this present work, the reaction of thiocarbohydrazide (A) with various ketones or aldehydes under microwave assisted technique as well as conventional heating method were studied. The precursor, thiocarbohydrazide (A), was first synthesized by hydrazine hydrate with dicarbone sulphate under reflux (scheme 1). The products of the reactions were monitored through thin layer chromatography (TLC) spotting using acetone : benzene solvent system. Each of the reactions gavw on spot with the Rf values varying 0.54 to 0.86. The result above indicated that microwave technique gave improved yield in less reaction time that the conventional heating method. The might because microwave couple directly with the molecules of the entire reaction mixture, leading to a rapid rise in temperature. The spectroscopic studies, the infrared spectra of the compounds 1-4 showed absorption bands due to the stretching vibrations of N-H, C=N, C=Ar, C=N, C=S at 3320-3141 cm⁻¹, 1643-1600 cm⁻¹, 1600-1506 cm⁻¹, 1264-1228 cm⁻¹, 1066-1022 cm⁻¹ respectively. The electronic transition of Uv-visible spectra in methanol gave rise to wavelength (λmax) ranging from 210 nm to 425 nm. The first wavelength (λmax) for all the compounds were found between 210-230 nm as a result of n-π* transition of the compounds indicating the presence of (C=S). The Uv-visible spectra of the hydrazones (1-4), experienced a bathochromic shift of about 15-30 nm to give higher λmax values at above 345 nm, which may be
ascribed to the chromophoric C=N group, characteristic of k bands of C=N functional group and gives additional wavelength values at above 400 nm. This may be due to the more extensive π conjugation contributed by the additional benzene nuclei.

Scheme 1. Reaction commonly used to prepare dihydrazone (1-4)
The chemical shift and multiplicity patterns of $^1$H and $^{13}$C NMR correlated well with that at the proposed structure. Viscosity for synthesized compound were recorded in tables 1, 2, 3, 4. Viscosity increases with increasing temperature as the mole fraction $x_1$ increases (introducing hydrazone (1) to hydrazone-water mixture), scheme 2. The is explained by strong hydrogen bonding between hydrazone and water at the same time destruction of self-associated molecules of water till reach the maximum at mole fraction ($x_1 \geq 0.8$). The H-bond (which is the main factor of the viscosity increase) is not alone factor influencing in the viscosity deviation of binary mixture, but another factors are important like the molecular size and also could be related to the spatial hindrance of a certain groups in the H-bonded network, in additional to the complex formation, and the dispersion forces may be dominance in these mixture. However, precise conclusion can hardly be drawn about the molecular interactions in liquid mixture from the nature of the mixture components, though suggestion can be given about the interactions from the studied physical properties deviations from additivity and other related phenomena. As for example, when the liquids are mixed together their may be either contraction (increase in density by association) or expansion in volume from additivity (decrease in density by decrease in association). Thus excess properties can give valuable information about molecular interactions between binary mixtures.

3.2 Antimicrobial activity

The antimicrobial activity of dihydrazones synthesized were summarized in table 2 and represented graphically in figure. The antimicrobial activity is highly influenced by the nature of the compound (figure) and the orders for Gram-positive bacteria (S. aureus) is follows 1 > 3 > 4 = 2, the order for Gram-negative bacteria (ex: P. phaseolicola) 1 > 3 > 4 = 2. All the investigated complexes exhibited low to moderate activities against the studied organisms relative to the standard reference (control). In conclusion the dihydrazones compounds
gave affair inhibitor effect on growth of microorganisms and were more potent as bacteriostatic agents.

The IISTE is a pioneer in the Open-Access hosting service and academic event management. The aim of the firm is Accelerating Global Knowledge Sharing.

More information about the firm can be found on the homepage: http://www.iiste.org

CALL FOR JOURNAL PAPERS

There are more than 30 peer-reviewed academic journals hosted under the hosting platform.

Prospective authors of journals can find the submission instruction on the following page: http://www.iiste.org/journals/ All the journals articles are available online to the readers all over the world without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself. Paper version of the journals is also available upon request of readers and authors.
