ABSTRACT

Corporate Social Responsibility (CSR) being one of the fastest changing areas of management today has few facets among scholars in the world, one school of thoughts believe CSR should be used mainly as a social endeavor and the others think it should be linked to the corporate strategy for financial performance. In this context, this paper aims to observe how strategic approach of CSR initiatives leads to sustainability specially an environment where economic wounds are been settling and new opportunities are been evolving after a 30 year long civil unrest in a society. The strategic antecedents recognized in this model are resource mobilization, market development and customer orientation and the study attempts to identify the core strategic focus of those in building CSR initiatives for sustainability. Accordingly, total of 360 shareholders/investors and managers among 40 corporates who were involved in CSR activities during 05 years after a long civil war in Sri Lanka was sampled. It has found that implementing CSR initiatives strategically aiming both resource mobilization and market development tend to support sustainability of those initiatives but aiming customer orientation has less impact otherwise. In conclusion, it is advisable for corporates to approach CSR initiatives strategically gaining a return to both the society and for them and also it is important that governments too support those initiatives in rebuilding process.

Keywords: strategic CSR, sustainability, rebuilding, resource mobilization and market development.

Introduction

Corporate Social Responsibility (CSR) is not a new concept in the management jargon, but perhaps this phenomenon is still a new area for certain markets in certain countries. After the publication of Friedman's (1970) thesis, which says the only social responsibility of a firm is to maximize profits, scholars started to develop and write various theoretical concepts in the area of corporate social responsibilities of a firm (Maigan, Ferrell, and Hult, 1999; Kuilck, 1998; Freeman 1984, Porter 1990, Dennis & Buchholtz, 2009, Liket & Mass, 2016). CSR, from that point onwards has covered many areas such as stakeholder analysis, business strategy and competitive advantage and corporates, governments, and customers. Further, research indicates that the other stakeholders have started to begin to feel the relevance and importance of CSR as meaningful managerial concept. According to Kok et al (2001) people also believe that a firm has an obligation to use its own resources with a commitment for the benefit of the society. CSR for decades has been a very critical subject among both scholars and practitioners and the meaning too is changing (Carroll, 1999, Secchi, 2007 and Lee 2008). The fundamental question is that what would be the role of a firm in the society other than their business perspective and what are their social responsibilities towards the betterment of the society. In the recent past one important argument evolved between the relationship between CSR and firm performance (Orlitzky et al., 2003). Also another factor to look is how they can be responsible to the larger society instead of engaging some charitable activities. Therefore, it is high time to search whether there is a new meaning for corporate social responsibility especially in a developing country like Sri Lanka after years of civil war.

Defining CSR

Corporate Social Responsibility can be understood in many ways as the exact definition is elusive since attitudes and beliefs fluctuate in different organizations and different situations. Kok et al (2001) defines CSR as an obligation of a firm to use its resources in ways to benefit society with a firm commitment for sustainability irrespective of there is a direct gain to the company or not. The concept over the years according to literature started developing towards the real responsibility of a firm towards the society. The belief is that when corporates make profits/earnings through the society why not they contribute back some for the betterment of the society. In the meantime, with the new developments and more commitments from organizations towards the responsibility of a firm towards the society, researches have given special attention to the relationship between CSR and a company's financial performance (Garone, 1999; Roman, 1999, Barnett 2016). Freeman (1984) brings two important stakeholder strategies among other: a stockholder strategy, referred as shareholder strategy and the social harmony strategy. Freeman (1984) says the shareholder strategy is to focus on profitability or ROC and the social harmony strategy is to address and balance various stakeholders of a firm.

With many developments among scholars in the world, one school of thoughts believe CSR should be used mainly as a social endeavor and the others think it should be linked to the corporate strategy for financial performance. Some scholars like Carroll (1999) and Freeman (1994) explain of focusing on economic/ shareholder perspective and philanthropic /social harmony perspective of CSR. CSR and financial performance is also a recent development among academics and practitioners (Orlitzky et al, 2003; Aguilera et al, 2007). Weeden (1998) describe that with the time companies started focusing on those social philanthropic CSR works to a proper directions or to a proper theme that has some relationship to the company's core business and he named it as a strategic philanthropy. Porter and Cramer (2006) describe that prevailing approaches to CSR today are so fragmented so disconnected from business and strategy and tells CSR can be much more than a charitable deed, which can be a source of opportunity, innovation and competitive advantage. Today all around the world due to heavy competition, organizations are feeling huge pressure to increase financial performance. Share prices are playing an important role and senior manager's compensations are more or less linked to it (Reich (1998). And Reich also explains that shareholders in today's context need to see some financial gains from their investments in CSR initiatives.

Importance of CSR in Developing Countries.

Although the concept of CSR as a management tool is new to developing countries, firms in those countries used to practice charitable work over many years. Of course, they did not use the word CSR but societies may have had a long lasting social contract with organizations (Turner, 1993). Rathnasiri (2003) suggests that among fifty local companies in Sri Lanka, there was no consensus in the corporate sector on what CSR is. Karyapperuma (2011) in his research findings on CSR involvement of Sri Lankan insurance companies suggests that majority of the companies considered CSR as a pure philanthropic act or totally as a marketing tool. He also says that many of the CSR activities are not strategically aligned to the overall operations of the organizations. Michael (2005) argues whether CSR can give a new meaning to companies and practice in the interest of poor and marginalized. Carron et al, (2006) argues the importance of CSR and poverty reduction and also the impact on CSR initiatives to the society for a longer period. It also emphasize the importance of sustainability of CSR in a developing country for better results. Aforesaid literature has been remained valuable argument for current study as whether CSR should be used as a social harmony strategy or as a corporate stakeholder strategy and also which strategy will lead to a sustainability in order for a developing country to gain reasonable results for the society at large. Since the involvement of private sector plays a pivotal role in developing countries, corporations may be the only viable means of ameliorating causes of great human misery (Scherer, Palazzo, & Matten, 2014).

Objectives and Scope of the Study

The main purpose of this research paper is to identify the use of CSR initiatives as a strategic perspective and whether it will lead to sustainability of those initiatives for a betterment of a society in developing country. Further it is important to find out the commitment of shareholders and managers for sustainable CSR initiatives and the factors leads to it. It is paramount important that any social or business strategy aligning with CSR should sustain in order to gain substantial benefits to both society and the organizations. The pilot study indicates few serious issues a country like Sri Lanka would face merely due to either lack of knowledge or ignorance if companies do not focus their CSR initiatives towards social endeavor or business strategy. Further and most importantly, two in-depth interviews were conducted among highly successful two Sri Lankan companies who are using CSR as a business strategy for over 05 years, reveals that it has helped them to either gained revenue, saved cost or increased operational efficiency whilst achieving societal objectives. The question arises as to whether sustainable CSR initiatives emerged when those linked to core business and treat as a business strategy.

Literature Review

The basic understand is that organizations are accountable to a larger society (Kerin et al: 2002, Barnett, 2016) as the thinking behind being accountable to the society is based on the fact that companies make their earnings from the society. At the same time, in the recent past the markets became highly competitive and the CEO's started to feel the pressure more than any other period, one key being the raising/keeping the investor

confidence. Therefore, new thinking started to emerge as Gal breath (2009) argues that although CSR discussions have generally focused on the role of business in society, at practical levels there appears to remain much confusion with respect of how to build or integrate CSR into the overall strategy of the firm. The arguments continuing as to whether it a social endeavor or business strategy. The most widely cited model of CSR is provided by Carroll (cited in Carroll & Buchholtz, 2002), in which the author considered economic responsibility as a base for all organizations CSR initiatives. Yet it doesn't take strategic aspect of CSR in to account i.e. aligning CSR with the company's core business strategies. Lantos (2001) clearly explains how CSR considers to be a strategic option. He says companies should make philanthropic actions which are both beneficial to the society and to the company, the initiatives that helps the organization to achieve strategic objectives with a clear financial return and ability of those to balance both shareholders and stakeholders. Some believes that it is very difficult for an organization to initiate CSR programs to the society at large (Clarkson, 1995). Instead, they suggests that companies should focus their CSR activities only on parties that are directly or indirectly affected (Wood & Jones, 1995). According to Haigh and Jones (2006) there are six main factors that affect organizations to engage in CSR initiatives namely, the pressure built internally on managers, pressure coming from competitors, investors, governments, non-governmental bodies and last the expectations of customers. Sustainability or continuous engagement of CSR initiatives, until it reaches to set objectives is paramount important both to the organization and to the society. CSR is no longer donating money for some needy course or it is not a department function.

According to Burke and Logsdon (1996) the cost incurred by the organizations on strategic CSR is not considered as a mere expense, instead treat it as an investment for a long term growth. It is because CSR helps both the organization and society to gain a win-win situation. Therefore, CSR must be linked to the strategy in order to create a value to the organization. Understanding the organizational environment and its implications are part of the strategic domain (Galbreath, 2008). Therefore, CSR decisions cannot be taken isolate and if it is strategic it should consider markets, customer needs, resources, and competitive advantage as strategic dimensions of CSR (Galbreath, 2008) among others. Although markets consists of all actual and potential buyers, Cahill (1997) describe what is important is addressing the specific target markets. Kotler and Armstrong (2005) suggests that strategic approach can develop specific market segments. This includes assessing the growth of the market, market share, nature of competition and resource requirement. In the strategic perspective of CSR, it is also important to address customer orientation of a firm. According to Narver and Slater (1990) it is the actions designed to create the value for both today and potential customers. Based on the understanding of the literature, CSR initiatives of a firm should increase or add value to the target customers for it to be strategic. Galbreath (2008) suggests that another dimension that a firm should look for is the internal resources when implementing CSR initiatives. He explains resources as activities, assets, core competencies, capabilities and dynamic capabilities of a firm. Peteraf (1993) describes that resource mobilization is part of a competitive advantage and Woodruff (1993) argues customer satisfaction is the next source of competitive advantage. Further, Barney (2001) explains markets and resource mobilization as a resource based view are part of competitive advantage. Therefore, in order to analyze strategic antecedents of CSR in this article the researcher takes resource mobilization, market development and customer satisfaction are parts of competitive advantages. In this context, the study is aiming to explore the relationship of these strategic CSR antecedents mainly resource mobilization, market development and customer orientation towards creating sustainable CSR programs.

Conceptual Framework and Hypotheses

The main argument of the study is whether use of CSR as a strategic tool will lead to generate sustainability of those initiatives in a developing country. According to the previous literature, strategic antecedents of CSR are the resource mobilization, market development and customer orientation (Galbreath, 2008). As per the literature review, previous authors have explored many constructs as CSR as corporate strategy antecedents in their empirical studies. However, some determinants are commonly used by many researchers and some are limited to specific situations only.

The conceptual framework demonstrates the relationship between strategic antecedents as a strategic choice and how those drive for sustainability.

Fig 01: Conceptual Framework

It is paramount important for an organization to match its internal resources with changing external environment in order to enhance the performance in the long run (Learned et al, 1969; Andrews, 1971). Further studies suggest various attributes of resources such as activities (Porter, 1985), assets (Dierickx and Cool, 1989), core competencies (Prahalad and Hamel, 1990), and dynamic capabilities (Teece et al, 1997). Rumelt (1980) clearly specifies that it is important to leverage resources to capture or internalize benefits of engage in CSR initiatives to the firm. Porter and Cramer (2006) explain the importance of not isolating the internal operating units for CSR initiatives. They also categorically mention that a firm tying a social issue more closely to its business, the greater the opportunity to leverage its resources. Therefore, based on the aforesaid arguments, the researcher developed the first hypotheses to emphiricallt test the argument in the present research context.

H1. Organizations who mobilize own resources for CSR initiatives tend to sustain CSR initiatives in the long run.

H2. Organizations who focus CSR initiatives as a market development view tend to sustain those initiatives in the long run.

H3. There is a positive relationship between customer satisfaction and the duration of the CSR initiatives.

As a Strategy

The researcher started analyzing CSR by relating it to a theory of the firm, means it assume that the management of publicly quoted companies attempt to maximize profits (Jensen, 1998). Friedman, (1970) asserts that engaging CSR as a symptomatic of an agency problem or a conflict between the interest of managers and shareholders. He argues that managers use CSR as a means to improve their own political, social, or career agendas, at the expense of shareholders. Based on this thinking, resources allocated to CSR would be more wisely spent, from a social endeavor perspective, on increasing firm efficiency. Wright & Ferris (1997) has empirically tested this theory and found out that stock prices reacted negatively to announcement of divestment of assets of a firm. Waddock & Graves (1997) presented their empirical test work of the corporate social performance and say that there is a positive association between corporate social performance and financial performance. The corporate social performance (CSP) model has many in common with the stakeholder perspective, which is the most widely used theoretical framework (McWilliams & Siegel, 2001).

Based on the studies of Jensen, (1998) CSR can be considered as a form of an investment. An investment to capitalize, companies need to think strategically and act strategically. Most recent treatments have progressed towards theory development as well as empirical tests of the relationship between CSR and firm performance (Aguilera, Rupp, Williams, & Ganapathi, 2007; Orlitzky, Schmidt, & Rynes, 2003). More importantly, CSR

should be integrated strategically in to the context of what the firm is trying to do. Such an approach is vital to building CSR into strategy in a way that reflects its actual business importance to the firm's mission (Burke & Logsdon, 1996). Building CSR in the fundamental purpose of the firm-its mission-does not necessarily happen without proper reflection and understanding of the environment (and the personal values and convictions of a firm's top leaders). Understanding the environment and its implications for the firm rests within the domain of strategy (Galbreath, 2009).

As mentioned earlier, if CSR can be viewed as an investment, one way to assess investment in CSR is as a way of product differentiation. It's commonly accepted that product differentiation leads a way to a competitive advantage. In this way there are CSR "resources" and 'outputs'. According to (McWilliams & Siegel, 2001) a firm can create a curtain level of CSR by embodying its products with CSR attributes (such as pesticide-free fruits) or by using CSR related resources in its production process (such as naturally occurring insect inhibitors and organic fertilizers). A classic example of ODEL, Sri Lankan company building CSR initiatives to embody into their product portfolio (Pilot survey, 2012) gave them a huge brand image lead to more sales and more CSR investments. Those firms taking the competitive advantage (CSR as a strategy) as their long term objective (mentioned as a mission) of CSR are likely to adopt CSR initiatives in three wide areas of company business interest: Resource mobilization, market developments and improving customer orientation.

Resource Mobilization

A resource is a stock or supply of money, materials, staff, and other assets that can be drawn on by a person or organization in order to function effectively. According to Business Dictionary it is also can be defined as an productive factor required to accomplish an activity, economic or or as means to undertake an enterprise and achieve desired outcome. Three most basic resources are land, labor, and capital; A major facet of strategy is concerned with matching internal resources with a changing external environment in a way that enhances organizational performance overtime (Andrews, 1987; Learned, Edmund Philip, Carl Roland Christensen, Kenneth R. Andrews, 1966). Further studies done by the researcher about resources have various attributes for it such as activities (Porter, 1985), assets(Dierickx & Cool, 1989), core competencies (Prahalad & Hamel, 1990), and dynamic capabilities (Teece, Pisano, & Shuen, 1997). Branco and Rodrigues (2006) suggest that CSR activities may have internal benefits by supporting a firm to develop totally new resources and capabilities and also it leads to important consequences on the creation or depletion of intangible resources. Specificity refers to the degree to which resources are leveraged to capture or internalize at least some benefits for engaging in CSR that are specific to the firm, rather than simply creating collective goods which can be shared by other in the industry, community or society at large (Porter, 1985; RUMELT, 1980). Bhattacharya (2009) finds out the active involvement of employees as an internal resource leads to better CSR initiatives.

Market Development

According to the work of Galbreath (2009) for firms to more adequately build CSR into strategy, the social dynamics variables becomes important interns of understanding the current and emerging characteristics of target markets. He further elaborate that if assessing various social factors of a given market segment is important to the general understanding of that segment, then it is also important in terms of understanding specific target customer needs. A market is the set of all actual and potential buyers of a good or service (Kotler & Armstrong, 2005). Customer orientation can be defined as the actions designed to understand the current and latent needs of customers in the target market served so as to create superior value for them (Narver & Slater, 1990).

Customer Satisfaction

Studies have found that the reputation of a company and the welfare of distinct stakeholder are crucial to stockholders wealth maximization and long term survival (Tirole, 2001). Also building better relations with primary stakeholders like employees, customers, suppliers and communities could lead to increased financial returns by helping firms develop intangible but valuable assets which can be sources of competitive advantages (R Edward Freeman, 1984). They also provided rational and justification for a marketing contribution to improvement of financial performance of a firm. Some of the factors identified by Srivastava

are customer satisfaction, specific marketing mix actions (mobilization of resources), product equity and impact of brand equity. With respect to customer satisfaction, the relationship between customer satisfaction and stock prices suggests customer satisfaction leads to excess returns (Luo, 2007). Carroll (1991) gives facts for using CSR for economic purposes under five points: it is important to perform in a manner consistent with maximizing earning per share; it is important to be committed to being as profitable as possible; it is important to maintain a strong competitive position; it is important to maintain a high level of operating efficiency and it is important that a successful firm be defined as one that is consistently profitable.

Definition of Variables

As the main construct of the conceptual framework are psychological phenomena, there are no universally accepted one definition for each construct. Therefore, in this section, the researcher attempts to define the major constructs of the research model. Those definitions are very useful in demarcating the scope of the present study and in avoiding misinterpretation of the constructs in the research model. All operational definitions were developed by the author based on various perspectives that have been presented in previous literature regarding those constructs. Therefore, the research design is based on the operational definitions demonstrated in Table below.

Concept	Definition
CSR as a Corporate Strategy	Firm's use of CSR initiatives to generate a positive return to the organization
Resource mobilisation	Use of organizational resources to activate CSR initiatives successfully.
Market Development	The ways CSR initiatives can contribute to the development of organizational target market(s).
Customer Satisfaction	The extent to which the customers are happy to continuously associate organizational products.
Sustainable CSR initiatives	Ability of a firm to execute a chosen CSR project for a longer period of time until the defined objectives being met.

Target Population and Sampling Frame

According to Bryman (2006) designing appropriate sampling is an important step of both qualitative and quantitative research projects. Babbie (2006) says population is the group that the conclusions are drawn upon. **The population** in this study is the listed companies operating at the Colombo Stock Exchange in Sri Lanka and the non-listed companies who have won international awards for CSR initiatives during last 03 year. The reason for the listed companies to be the population is that according to the triple bottom line reporting system it is mandatory for listed companied to report CSR under sustainability reporting. In deriving sample, the researcher has resorted to judgmental and random sampling methods. For the research the sample was derived based on the 40 listed companies and the researcher designed the sample by analyzing the companies who are actively and continuously into CSR initiatives. In each sample entity, 10 people were identified on a random sampling basis to interview as managers and shareholders/investors which comprised to 400 respondents. The managers of companies were selected based on the amount of involvement to CSR projects and also the impact of CSR projects to company's core business strategyThe selection of shareholders/investors, managers and beneficiaries will be on random simple sampling method as mentioned above.

Data Collection, Data Analysis and Interpretations

As per the convenience purpose the data collection for the pilot survey was done both by using electronic mail survey and field interviews. But due to the difficulties faced in terms of explaining some questions, the researcher decided the best method is to use only field surveys. The researcher used 10 personal assistance as enumerators from time to time to accompany the researcher for the purpose of convenience. The researcher has used frequency percentage to summarize, descriptive data analysis and structural equation methods to test hypotheses were used. For the purpose of descriptive data analysis, frequency analysis is used with the help of SPSS (Statistical Package for the Social Science) version 20 software.

Multicolinirity

As per the table it is evident that all explanatory variables are away from multicolinerity issues.

Variable	Shared Multiple	Tolerance	Variance	
	Correlation (SMC)	Statistics	Inflation Factor	
		(TS)	(VIF)	
Resource Mobilization	.470	.521	1.336	
Market Development	.298	.341	1.878	
Customer Satisfaction	.267	.656	1.342	
Sustainable CSR	.694	.563	3.212	
Initiatives				

Base on the above descriptive statistics, it is clear that firms adopt market development approach (M=3.5125, SD=.57054) heavily as a CSR business model in firm environment. Alternatively, resource mobilization (M=3.2521, SD=.67292) seems to have been given the low priority within the CSR business model. This shows that more than using company's resources like core competencies, capabilities and assets utilization for CSR initiatives, shareholders and managers are willing to improve their market share, market presence, and building positive image in the market. It is observed that, as per the managers view point firms have low customer orientation. Based on the experience of the researcher, this is obvious that Sri Lankan managers and shareholders are keen in developing market image by engage in CSR and also they themselves get involved to grater extend to those event by mobilizing internal resources. This study studied the manager's cognitive evaluation of customer's satisfaction towards CSR initiatives of the firm. It is observed that managers believe that CSR initiatives increase the customer satisfaction (M=3.9783, SD=.51309). Respondents of the firms believe that CSR activities tend to increase positive word of mouth, customer satisfaction, retention, and appreciation.

Exploratory Factor Analysis (EFA)

This study applied the principle component analysis to explore the dimensions underlying the strategic antecedents. Exploratory Factor Analysis (EFA) and Principal Components Analysis (PCA) both are methods that are used to help investigators represent a large number of relationships among interval-level variables in a simpler (more parsimonious) way. Both of these approaches allow the computer to determine which, of a fairly large set of items, "hang together" as a group, or are answered most similarly by the participants.

Accordingly, inspection of the correlation matrix revealed significant correlations between the items and those correlations met the criteria of $0.80 = \langle R \rangle = 0.30$. The KMO values of .784 exceeded the recommended minimum criteria of 0.6 (Kaiser,1974) and Bartelet's test of Sphericity was clearly significant (Chi-Squared value=1450.035 df=153 and sig=0.00) indicating that correlation matrix not an identity matrix. Hence, in all data was suitable for factor analysis (PCA).

Three components with eigenvalues>1 (Kaiser, 1974) emerged from the analysis explaining 5.173, 3.280, and 2.869 of the variance, respectively. Inspection of the scree plot reveals the three components to be retained.

In order to increase the interpretation of factors orthogonal Varimax rotation have been conducted and items loaded on factors greater than 0.40 have been taken into account and suppress the other loadings. Rotation of component matrix revealed three components as suggested by the researcher and items which were utilized to measure the dimensions were loaded on each components.

Findings and Discussions

The main objective of the study is **to examine the possibility of linking firm's CSR initiatives to the core business and treats it as a strategy.** Burke and Logsdon (1996) clarifies that the economic responsibility of a firm is to produce profits constitutes part of the firm's formal social contracts, by identifying and exploring unmet societal needs and societal issues through strategy dimensions such as market served, customer needs and resources required to compete, a firm not only can address social opportunities that generate profits (thereby meeting its economic responsibility to shareholders), but can offer societal benefits as well. They further suggest that a properly designed CSR program with a use of resources and capabilities of the firm create value for the firm. The study has focused under strategic antecedents such as market development, resource mobilization and customer satisfaction are key questions raised from the respondents of companies to measure one component of the strategic antecedents. As far as strategic CSR is concerned, McWilliams and Siegel (2011) point out that CSR, which is embedded in an integrated strategy, may be considered as strategic CSR. They also elaborate that it will lead to the sustainable competitive advantage.

Lawson (2011) suggests that firms that use CSR as a central element to their core business missions have a better chance of creating more business values. The reason he gives is then at the particular firm develop resources and capabilities to solve social problems that can be then applied to the organizations business operations. Lawson (2011) also says the creating a value through CSR projects to the organizations core business model can reduce cost. The reason for this is that the company use its expertise and those projects are within the company's business domain hence, the greater monitoring can take place, thus chances of reducing the cost is high when compared to the CSR initiatives that has no understanding at all. Hart and Sharma (2004) explains that when companies use their own resources to CSR initiatives, the experience the managers are getting by dealing with specially poor communities gain larger exposure which can intern use for business gains of the operations specially when the target market is mass and low income. Therefore, as supported by literature and the study itself both quantitative study and in-depth interviews, the companies who select CSR as a strategic perspective significantly achieve greater satisfaction among shareholders and customers and lead to sustainability of selected initiatives.

Conclusion

It is much evident that based on the above study that when organizations practice CSR strategically, the sustainability of those initiatives is much stronger. For a developing country like Sri Lanka one of the most important elements is the sustainability of CSR initiatives to harness the true results to the society. The argument put forward was the ability to get the firm's long-term commitment towards designed CSR initiatives from organizations. The researcher believes based on the above study that the long-term commitment (sustainability) is high when firms select CSR initiatives, which has benefits both to the society and the organizations. Therefore, the study suggests that organizations specially operating in developing countries such as Sri Lanka should pay special attention to strategic CSR projects for the mere purpose of sustainability.
