Abstract

The quality of the hospital is very much determined by two main factors, namely the service by hospital staff and the building and infrastructure of the hospital itself. In contrast to numerous studies and case reports on the physical complications of genital mutilation, little scientific research is available on the sexual and psychological effects of the practice. The impact that can be caused when both of these factors are not met with good is the poor hospital services, both in normal circumstances and during a disaster. Likewise, if there is an incident of malpractice in a hospital of the same type, then the law enforcement officers will easily to examine by simply checking the service standards set by the government by looking the type of hospital. It recommended that the government should be responsible establish the National Service Standards in each hospital of the same type in which it should have the same standard operating procedures in its care. In this context, the Provincial Government of South Sulawesi established a legal institution that houses hospitals or patients so that not only patients have the right to complain about their disappointment with hospital services, but hospitals can complain about patients violating the rules set by the government so that the principle of justice is achieved.

Keywords: *Obstetrics and Gynecology; Responsibility; Health Right; Local Government*

1. Introduction

Healthy represents a condition that always expected and desired by every human in their life. Therefore, everyone tries to be healthy so that they can live well. In the Indonesian Health Act, it is emphasized that “*Everyone has the right to health*”. Thus, everyone has the same rights to access resources in the health sector and has the right to obtain safe, quality and affordable health services.

In health care, in addition requires health personnel, it also need assistance from other parties, so that health care can achieve as expected. The other party is health facilities such as hospitals. In the hospital, health personnel work to provide health care for those who need it.¹ It occurs a legal relationship in the form of therapeutic transactions or healing agreements between those who provide health care and those who receive health care.

At a practical level, however the implementation of health care is often encountered a conflict between health personnel and recipients of health services or patient. The relationship between health personnel and recipients of health services is based on 2 (two) characteristics, namely the agreement on a care or services (*consensual*) and a trust (*fiduciary*) between service providers and recipients of health services.² Conflicts between parties or malpractice in health services, especially in the service on Obstetrics Genecology departments is one of the problems among many problems in the implementation of health services, and become a medical problem in this country.

According to the WHO's data, 99% of maternal deaths due to labor or birth problems occur in developing countries. The ratio of maternal mortality in developing countries is the highest, 450 maternal deaths per 100.000 live births. When compared with the ratio of maternal mortality in nine developed countries and 51 developing countries.³

³ Source: <http://www.who.int/news-room/fact-sheets/detail/maternal-mortality> Accessed on 8 January 2018.

In Indonesia, it is estimated 14 million cases of hemorrhage in labor. At least 128.000 women experience until death. Postpartum hemorrhage, especially primary postpartum hemorrhage is the most common cause of maternal death. Primary postpartum hemorrhage is postpartum hemorrhage that occurs within the first 24 hours of birth. Many factors cause death in maternity mothers or postpartum, both directly and indirectly, but most of them are direct causes. The direct cause consists of various cause, the most dominating is eclampsia.¹

Actually, these cases have happened for a long time, but mostly protracted because of different views by health personnel or workers, scientists or legal practitioner in highlighting cases that occur, especially in gynecology department. In the reality that the failure of health services is also due to the consequences of the late handling of patients who need immediate handling, it encompasses an emergency. There are 2 (two) problems that can arise in an emergency, namely the patient comes to the hospital with a disease condition that is already unable to be helped and is already severe or those comes with a referral from another health facility with conditions that are also in an emergency in other words late referring to the hospital.

As a comparison, in some developing countries, peoples often pass through early-level health facilities, leading to higher referral rates in advanced health facilities. The causes of high referral rates in advanced health facilities are due to lack of utilization of lower-level health facilities or lack of quality of referral services at lower levels, whereas if we see that diseases do not recognize the level of health services, the government needs to review the levels of health services to be fair and provide health rights for all Indonesian people, as mandated by the 1945 Constitution of the Republic of Indonesia as stated in the Pancasila that “*Social Justice for all Indonesian People*”.

In terms of health law, the absence of national service standards will harm not only the health workers, but also the community as recipients of services. Therefore, there is a need for national service standards in health services to protect the community as recipients of health services or health workers themselves. Technological advances in biomedical fields coupled with the ease of obtaining information and communication in this globalization era make it easier for patients to get second opinions from various parties, both from domestic or foreign level, which if doctors or health personnel are not careful in giving explanations to patients, will result in reduced patient trust in the doctors and health personnel.²

2. Government Policy Against the Right to Health in Giving Obstetrics and Gynecology Services at Hospitals

The quality of the hospital is very much determined by two main factors, namely the service by hospital staff and the building and infrastructure of the hospital itself. In contrast to numerous studies and case reports on the physical complications of genital mutilation, little scientific research is available on the sexual and psychological effects of the practice.³ The impact that can be caused when both of these factors are not met with good is the poor hospital services, both in normal circumstances and during a disaster.

Improvement of Public Health Services can not be separated from the Availability of Health Facilities. One of the health development missions in realizing the 2015 healthy Indonesia vision is to maintain and improve quality, equitable and affordable health services, which means that one of the responsibilities of the health sector is ensuring the availability of the best, quality, equitable and affordable health services. To achieve this, various health service efforts have been carried out.

In line with this matter, based on the author's interview with the head of the Health Office in this case it was represented to the health department secretary that the South Sulawesi Provincial Government considered that the weakness of public health services, especially in hospitals under the auspices of the South Sulawesi provincial government, had been facilities and infrastructure in health facilities. some are inadequate, and the most felt is access to information about health services that will create an integrated health service for the community.

³ Toubia, Nahid. "Female circumcision as a public health issue." *New England Journal of Medicine* 331.11 (1994): 712-716.

In addition, the attitude shown by health care workers is still the presence of officers who do not obey the professional ethics they have received during their education. Therefore, the disposition factor must be improved in order to provide good health services to the community. The increasing number of community needs for public health services is a factor that supports the implementation of public health service policies in several hospitals in South Sulawesi Province.

The results of research related to the performance and discipline of health workers for private hospitals in Makassar have no constraints due to existing rules in the company, management that makes and rewards and punishment they really apply this because the hospital status is private or corporate while the government hospital still has violations and the discipline of officers is proven by looking at the staff data at the hospital.

Undisciplined officers who reflect each individual's character and are clear about things like this have a reduced performance and this has been proven by the number of patients in the last 3 years has also declined. In addition, when examining the two hospitals under the auspices of the South Sulawesi Provincial Government, they were under construction as one of the improvements in facilities and infrastructure. For this reason, the responsibility and authority of the provincial government to fix and manage the problems of the performance of health workers in these two hospitals.

In order to improve the degree of public health, both in urban and rural areas, the government must set clear and measurable standards so that they are easily implemented in each region. To avoid inequality in its implementation, there must be a minimum standard that can be applied to all regions. The Minimum Service Standards set by the Government have not been fully implemented by all regions in Indonesia. This is understandable considering that health problems are basic needs of the community with a very wide reach.

The results show that Minimum Service Standards (SPM) also become very strategic in relation to the implementation of the National Health Insurance, which until now is still in good trouble, which is constrained by long procedural and bureaucratic problems and financial problems and other technical matters. The application of Minimum Service Standards will strengthen the promotion and preventive side so that it is expected to have an impact on reducing the number of curative cases that must be borne by the National Health Insurance.

Likewise, the case with the Minimum Service Standards in hospitals that aims to improve services at the upper level of service in which services receive referrals from lower-level health facilities, which of course all deficiencies and inadequacy of lower-level services are at the highest level of services, namely hospitals. Government efforts to fulfill the rights of the people in the field of health at the upper level. Even so, there are still many complaints and public dissatisfaction with the services provided by the government, both the central government and the regional government. In fact, since 2005 Government Regulation Number 65 of 2005 has been issued which contains provisions on the Guidelines for Preparation and Application of Minimum Service Standards, even reinforced by the Minister of Home Affairs Regulation No. 6 of 2007 concerning Technical Guidelines for Preparation and Determination of Minimum Service Standards.

At practical level, there are several problems that affect the types of services provided by health care providers, dispositions or attitudes given by health care workers who are considered by some to be inadequate, the availability of health workers, and facilities and infrastructure to support health services, and problems other problems related to hospital services. For this reason, with the problems that occur in the application of the Minimum Standards, it is specified by making and designing Operational Standards Procedures to minimize problems and even solve problems, for example in health services are expected to be absent or minimize conflicts, malpractice and so forth and service is expected to run smoothly and the level of community satisfaction is fulfilled.

3. Assessing the Minimum Service Standards for Health Services

In order to improve the health level of the community, both in urban and rural areas, the government must establish clear and measurable standards so that it is easily implemented in each region. To avoid inequality in its implementation, there must be a minimum standard that can be applied to all regions. Minimum service standards that have been set by the Government have not yet been fully implemented by all regions in Indonesia. This is understandable given that health problems are a basic need of people whose reach is very broad.

If the service agency has a service standard, then the service is called very good or best or will be excellent, when it can or is able to satisfy the party served (*customer*). Such excellent service is suitable to the expectation of customer. Certainly, if an excellent service can be measured, for service providers that do not have service standards, it is necessary to make service standards in accordance with their duties and functions. If we consider carefully, the service process does not only includes activities when customers face to face directly with service personnel, but it also includes activities before and after. A service will not be excellent if it does not completely cover it. Excellent service is a comprehensive service.

Based on the Decree of the Minister of Administrative Reform No.63/KEP/M.PAN/7/2003 that in providing public services must contain the following elements:

- a. Rights and obligations for providers and recipients of public services must be clear and known by each.
- b. The arrangement of any public service must be adjusted to the conditions of the needs and ability of the community to pay based on the prevailing laws and regulations while still adhering to efficiency and effectiveness.
- c. The quality of the process and the outcome of public services must be endeavored to provide security, comfort, smoothness and legal certainty that can be accounted for.
- d. If public services by government agencies to be expensive, the relevant government agency is obliged to provide opportunities for the community to participate in organizing it in accordance with the prevailing laws and regulations.

The Public Services Acts (officially named Act No. 25 of 2009 concerning Public Services) is a law that regulates the principles of good governance as an effectiveness of government functions themselves. The State is obliged to serve every citizen and population to fulfill their basic rights and needs within the framework of public services as mandated by the 1945 Constitution of the Republic of Indonesia.

Building public trust in public services as conducted by public service providers is an activity that must be conducted in line with the expectations and demands of all citizens and population about improving public services.

Agencies that perform public services can develop their own patterns of service delivery in an effort to find and create innovations to improve public services. The development of the pattern of public service is intended to follow the principles and objectives of the implementation of public services.

The drafting of the principles and objectives of public services is used as a guideline in public services by government agencies and can be used as an indicator of the quality of services that have been given to the welfare of people's lives in accordance with applicable regulations. Health is a basic need of every human being and as a capital of every citizen and every nation in achieving its goals and achieving prosperity. A person cannot fulfill all of their life's needs if they are in an unhealthy condition, so that health is the capital of each individual to continue their life properly.

The government has a responsibility to ensure every citizen obtains quality health services according to needs. As a basic need, each individual is responsible for fulfilling their life needs and peoples they are responsible for, so that basically meeting the needs of the community for health is the responsibility of every citizen and government.

Discussing about health services as our responsibility and seeing how health care is very primary where someone who needs help at that time also help as if it does not provide certainty either in terms of acceptance by health services or hospitals that end with disappointments and conflicts between officers and service recipients. Where the government has specialized that health is one of six concurrent affairs is compulsory and related to basic services. The six affairs as follows:

1. Education
2. Health
3. Public Works and Spatial Planning
4. Public Housing and Settlement Areas
5. Peace and Public Order and Community Protection
6. Social

By the inclusion of health in compulsory affairs, a Minimum Service Standard was designed by the Ministry of Health, which then changed from the Performance of Ministry Program to the Performance of Regional Government which has the consequences of reward and punishment, so that the provincial

government is expected to ensure the availability of resources (facilities, infrastructure, tools, personnel and money or costs) so that the process of implementing the Minimum Service Standards runs adequately. Because the condition of provincial government resources throughout Indonesia is different in carrying out these six functions, the implementation of these matters is regulated by the Minimum Service Standards to ensure the availability of these services for all citizens.¹

Minimum Service Standards are provisions concerning the type and quality of basic services which are mandatory government affairs that are entitled to be obtained by every citizen at a minimum. Every citizen in accordance with their nature is obliged to fulfill the basic needs of their life by utilizing all of their human potential. On the contrary, the Central and Local Governments are obliged to ensure that every citizen can exercise their rights to fulfill their needs without obstacles from any party. The foregoing things make all elements united to work together to achieve the targets of the Minimum Service Standards, including the fulfillment of human resources in the health sector.

In this study, the author see that the Minimum Service Standards also become very strategic in relation to the implementation of National Health Insurance, which until now is still problem either constrained by the problems of long procedures and bureaucracy and financial problems and other technical problems. The application of the Minimum Service Standards will strengthen the promotion and preventive aspects so that it is expected to impact on the reduction in the number of curative cases that must be borne by the National Health Insurance.

Likewise, the Minimum Service Standards in hospitals that aim to improve services at the higher-level of service in its service receive referrals from lower-level health facilities which of course all the shortcomings and inability of lower-level services are at the higher-level services, namely hospitals.

Government efforts to fulfill the people' rights in the health sector at the higher-level. Nonetheless, there are still many complaints and dissatisfaction with about the services provided by the government, both the central and local governments. In fact, since 2005 the Government Regulation No. 65 of 2005 has been issued which contains provisions concerning the Guidelines for the Preparation and Application of Minimum Service Standards even reinforced by the Regulation of Domestic Affairs No. 6 of 2007 concerning Technical Guidelines for Preparing and Determining Minimum Service Standards.

The policy of the central government regarding the Minimum Service Standards by the provincial government of South Sulawesi has been enacted in the form of a Governor Regulation concerning Regional Minimum Service Standards. Minimum Service Standards as is known are a reference used to measure the quality and quantity of public services provided including public health services.

In the implementation of these policies, there are several problems that affect such as the lack of maximum types of services provided by health care workers, dispositions or attitudes given by health workers that are considered by some to be poor, the availability of health workers/personnel, and facilities and infrastructure to support health services, as well as other problems related to hospital services. Therefore, such problems in the implementation of the Minimum Service Standards, it is specified by creating and designing Standard Operating Procedures to minimize problems and even solve problems, for example in health services, the absence or minimization of conflicts, malpractice and other services and it is expected to run smoothly and community satisfaction levels are met.

4. Government Responsibility for Health Services in a Legal Perspective

Hospital is a health service institution that applies complete individual health services that provide inpatient, outpatient and emergency services. According to Act 44 of 2009 concerning Hospitals in Article 1 paragraph 1 "*hospital is required to be able to provide the best health services for patients specifically and for the communities at large.*"

The quality of the hospital is largely determined by 2 (two) main factors, namely service by hospital staff and buildings and infrastructure of the hospital itself. The impact that can be caused when these two factors are not met properly is the poor hospital service, both in normal conditions and when a disaster occurs.

Improving public health services is inseparable from the availability of health facilities. One of the health development missions in realizing the vision of Healthy Indonesia 2015 is to maintain and improve quality,

¹ Mathur, P. (2014). Role of Hospital Housekeeping and Materials Management Including Disinfection and Waste Management. In *Hospital Infection Prevention* (pp. 81-89). Springer, New Delhi, pp 23-24

equitable and affordable health services, it means that one of the responsibilities of the health sector is to ensure the availability of the best, quality, equitable and affordable health services for the community.¹ To achieve this, various health care efforts have been carried out.

In addition, in the aspect of resources also need to be supported by the availability of facilities needed in the implementation of health services. The condition of facilities and infrastructure at some of the hospitals is that the existing health facilities are different from one hospital to another. From these data the author saw that the lack of health facilities and infrastructure made it possible for a poor management of public health services.² This aspect of resources is one of the supporting factors in creating a comprehensive health service.

An interview with the head of the Health Office were represented by the secretary of the Health Office that the Provincial Government of South Sulawesi considered that the weaknesses of public health services, especially in hospitals under the auspices of the Provincial Government of South Sulawesi were inadequate facilities and infrastructure, and the most noticeable is access to information about health services that will create an integrated health service for the community.

In addition, the attitude of health personnel in which there are personnel who do not obey the professional ethics they have received during education. Therefore, the disposition factor must be improved so that it can provide good health services to the community. However, according to him, such weakness occurs due to factors including:

The increasing number of community needs for public health services as a factor that supports the implementation of public health service policies in several hospitals in South Sulawesi Province. Environmental factors are the next factor in assessing the performance of health services in the community. As already known, the environment is an important factor in the implementation of health services in several hospitals studied. Environmental conditions are one of the supporting factors in the implementation of a comfortable health service. A clean and comfortable environment is part of policy implementation that promotes a good health service to the community.

Resource is one of the important factors in the process of implementing a program or policy, without the support of adequate resources, both in the form of numbers and abilities or skills and managerial abilities in implementing health services in several hospitals.

In the implementation, it is necessary for the implementer to support the implementation of the policy properly. Without the personnel to run a program, any policy cannot work and only remains as a document without realization. Therefore, the availability of executors who are competent enough to encourage the success of the policy. To look back at the reality, the conditions of personnel or health workers that all health facilities still need improvement and still less than what is expected and the role of government is very strong to make improvements.

The development of extensive performance and it is intended that more work areas are included in measuring performance; it also that more management functions are included in measuring performance, while external development is interpreted by more external parties calculated in measuring performance.

Process performance describes whether a process designed in an organization allows the organization to achieve its mission. Individual performance describes how far someone has carried out the main activities so as to achieve results as determined by the institution. Organizational performance is related to how far an institution has carried out all the main activities so as to achieve the mission or vision of the organization.

Performance assessment can be used as a measure of the success of an organization within a certain period of time. These assessments can also be used as input for further improvement or improvement in organizational performance.³ Organizational objectives must be planned as best as possible by involving members of the organization, from formulation to implementation or effort to achieve it, shows the position,

authority and responsibility of each in a cooperation and work procedures will be very beneficial for the organization in terms of helping the coordination and integration of work, and help monitor the work of the organization so that it can be known whether an activity is going well or bad.

As described above, the measurement of the performance of public organizations can be done internally and externally. Internal assessment is to know whether the process of achieving the objectives is in accordance with the plan when viewed from the process and time, while the external assessment is done by measuring community satisfaction with the services provided by the organization. For organizations, effective performance means that output is maintained even if the amount of work is small, or productivity is increased. It should be emphasized that the effectiveness of person' performance depends on the organization itself, whether it has a clear vision, mission, strategy and goals.

5. Conclusion

The quality of the hospital is very much determined by two main factors, namely the service by hospital staff and the building and infrastructure of the hospital itself. In contrast to numerous studies and case reports on the physical complications of genital mutilation, little scientific research is available on the sexual and psychological effects of the practice. The impact that can be caused when both of these factors are not met with good is the poor hospital services, both in normal circumstances and during a disaster. Likewise, if there is an incident of malpractice in a hospital of the same type, then the law enforcement officers will easily to examine by simply checking the service standards set by the government by looking the type of hospital.

It recommended that the government should be responsible establish the National Service Standards in each hospital of the same type in which it should have the same standard operating procedures in its care. In this context, the Provincial Government of South Sulawesi established a legal institution that houses hospitals or patients so that not only patients have the right to complain about their disappointment with hospital services, but hospitals can complain about patients violating the rules set by the government so that the principle of justice is achieved.
