Abstract
A mathematical model is constructed to study the effect of heat transfer and elasticity of flexible walls with porous medium in swallowing of food bolus through the oesophagus. The food bolus is supposed to be Jeffrey fluid and the geometry of wall surface of oesophagus is considered as peristaltic wave through porous medium. The expressions for temperature field, axial velocity, transverse velocity and stream function are obtained under the assumptions of low Reynolds number and long wavelength. The effects of thermal conductivity, Grashof number, Darcy number, magnet, rigidity, stiffness of the wall and viscous damping force parameters on velocity, temperature and stream function have been studied. It is noticed that increase in thermal conductivity, Darcy number, Grashof number and the Jeffrey parameter results in increase of velocity distribution. It is found that the size of the trapped bolus increases with increase in the Jeffrey parameter, rigidity and stiffness.

Keywords: Magnetohydrodynamic, Peristaltic transport, Oesophagus, Jeffrey fluid, Porous medium, Food bolus.

1. Introduction
Peristaltic transport is a mechanism of pumping fluids in tubes when progressive wave of area contraction or expansion propagates along the length on the boundary of a distensible tube containing fluid. Peristalsis has quite important applications in many physiological systems and industry. It occurs in swallowing food through the oesophagus, chyme motion in the gastrointestinal tract, in the vasomotion of small blood vessels such as venules, capillaries and arterioles, urine transport from kidney to bladder. In view of these biological and industrial applications, the peristaltic flow has been studied with great interest. Many of the physiological fluids are observed to be non-Newtonian. Peristaltic flow of a single fluid through an infinite tube or channel in the form of sinusoidal wave motion of the tube wall is investigated by Burns and Parkes, Shapiro et al. etc., In the literature some important analytical studies on peristaltic transport of non–Newtonian fluids are available Devi and Devanathan, Shukla and Gupta, Srivastava and Srivastava, Usha and Rao, Vajravelu et al. (2005a, 2005b), Hayat et al. (2008, 2010a, 2010b).

Further an interesting fact is that in oesophagus, the movement of food is due to peristalsis. The food moves from mouth to stomach even when upside down. Oesophagus is a long muscular tube commences at the neck opposite the long border of cricoids cartilage and extends from the lower end of the pharynx to the cardiac orifice of the stomach. The swallowing of the food bolus takes place due to the periodic contraction of the esophageal wall. Pressure due to reflexive contraction is exerted on the posterior part of the bolus and the anterior portion experiences relaxation so that the bolus moves...
The contraction is practically not symmetric, yet it contracts to zero lumen and squeezes it marvelously without letting any part of the food bolus slip back in the opposite direction. This shows the importance of peristalsis in human beings. Mitra and Prasad studied the influence of wall properties on the Poiseuille flow under peristalsis. Mathematical model for the esophageal swallowing of a food bolus is analyzed by Mishra and Pandey. Kavitha et al. analyzed the peristaltic flow of a micropolar fluid in a vertical channel with longwave length approximation. Reddy et al. studied the effect of thickness of the porous material on the peristaltic pumping when the tube wall is provided with non-erodible porous lining. Lakshminarayana et al. studied the peristaltic pumping of a conducting fluid in a channel with a porous peripheral layer. Radhakrishnamacharya and Srinivasulu studied the influence of wall properties on peristaltic transport with heat transfer. Rathod et al. studied the influence of wall properties on MHD peristaltic transport of dusty fluid. A new model for study the effect of wall properties on peristaltic transport of a viscous fluid has been investigated by Mokhtar and Haroun, Srinivas et al. studied the effect of slip, wall properties and heat transfer on MHD peristaltic transport. Sreenadh et al. studied the effects of wall properties and heat transfer on the peristaltic transport of a Jeffrey fluid with variable viscosity through a porous medium in an asymmetric channel.

Motivated by this, we consider a mathematical model to study the effect of wall properties and heat transfer on swallowing the food bolus through the oesophagus. Afsar Khan et al. analyzed the peristaltic transport of a Jeffrey fluid with variable viscosity through a porous medium in an asymmetric channel.

2. Mathematical Formulation

Consider the peristaltic flow of an incompressible Jeffrey fluid in a flexible channel with flexible induced by sinusoidal wave trains propagating with constant speed $c$ along the channel walls.

![Fig(1) : Geometry of the problem](image)

The wall deformation is given by

$$H(\tilde{x}, \tilde{t}) = h - \phi \cos \frac{\pi}{\lambda} (\tilde{x} - c \tilde{t})$$

where $h$, $\tilde{x}$, $\tilde{t}$, $\phi$, $\lambda$, and $c$ represent transverse vibration of the wall, axial coordinate, time, half width of the channel, amplitude of the wave, wavelength and wave velocity respectively.

3. Basic equations

The basic equations governing the non-Newtonian incompressible Jeffrey fluid are given by:

The continuity equation is given by:
\[
\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0, \quad (2)
\]

The momentum equations are:

\[
\rho\left(\frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y}\right) = -\frac{\partial p}{\partial x} + \mu \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2}\right) + \rho g \alpha (T - T_0) - \sigma B_0^2 u - \frac{\mu}{k} u, \quad (3)
\]

\[
\rho\left(\frac{\partial v}{\partial t} + u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y}\right) = -\frac{\partial p}{\partial y} + \mu \left(\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2}\right) - \frac{\mu}{k} v, \quad (4)
\]

The temperature equation is given by:

\[
\rho \left(\frac{\partial T}{\partial t} + u \frac{\partial T}{\partial x} + v \frac{\partial T}{\partial y}\right) = \frac{k}{c_p} \left(\frac{\partial^2 T}{\partial x^2} + \frac{\partial^2 T}{\partial y^2}\right) + \Phi, \quad (5)
\]

where \(\bar{u}\) is the axial velocity, \(\bar{v}\) transverse velocity, \(\bar{y}\) transverse coordinate, \(\rho\) fluid density, \(p\) pressure, \(\mu\) fluid viscosity, \(g\) acceleration due to gravity, \(\alpha\) coefficient of linear thermal expansion of fluid, \(B_0\) magnetic field, \(T\) temperature, \(c_p\) specific heat at constant pressure, \(k\) is the thermal conductivity and \(\Phi\) constant heat addition/absorption.

The velocity and temperatures at the central line and the wall of the peristaltic channel are given as:

\[
T = T_0 \quad \text{at} \quad \bar{y} = 0
\]
\[
T = T_1 \quad \text{at} \quad \bar{y} = \bar{h}
\]
where \(T_0\) is the temperature at centre is line and \(T_1\) is the temperature on the wall of peristaltic channel.

The governing equation of motion of the flexible wall may be expressed as:

\[
L' = p - p_0
\]

where \(L'\) is an operator, which is used to represent the motion of stretched membrane with viscosity damping forces such that

\[
L' = -\tau \frac{\partial^2}{\partial x^2} + m_1 \frac{\partial^2}{\partial t^2} + C \frac{\partial}{\partial t}
\]

where \(\tau\) is the elastic tension in the membrane, \(m_1\) is the mass per unit area, \(C\) is the coefficient of viscous damping forces.

Continuity of stress at \(\bar{y} = \bar{h}\) and using momentum equation, yield

\[
\frac{\partial}{\partial x} (L'(\bar{h})) = \frac{\partial p}{\partial x} = \frac{\mu}{1 + \lambda_1} \left(\frac{\partial^2 \bar{u}}{\partial x^2} + \frac{\partial^2 \bar{v}}{\partial y^2}\right) + \rho g \alpha (T - T_0) - \rho \left(\frac{\partial \bar{u}}{\partial t} + u \frac{\partial \bar{u}}{\partial x} + \frac{\partial v}{\partial y}\right) - \sigma B_0^2 \bar{u} - \frac{\mu}{k} \bar{u} \quad (8)
\]

In order to simplify the governing equations of the motion, we may introduce the following dimensionless transformations as follows:
x = \frac{x}{\lambda}, \quad y = \frac{y}{\lambda}, \quad \delta = a, \quad u = \frac{u}{c}, \quad v = \frac{v}{\nu}, \quad p = \frac{a^2 p}{\mu \lambda c}, \quad t = \frac{c t}{\lambda}, \quad \psi = \frac{\psi}{\alpha c}, \quad Q = \frac{Q}{a \lambda}, \quad \phi = \frac{\phi}{a}, \quad Da = \frac{k}{a^2}

\begin{align*}
\text{Re} &= \frac{\rho c a}{\mu}, \quad \text{Gr} = \frac{g \rho a^2 \alpha (T_1 - T_0)}{\mu^2 c^4}, \quad \theta = \frac{T - T_0}{T_1 - T_0}, \quad M^2 = \frac{\sigma B_0^2 a^2}{\mu}, \quad \beta = \frac{a^2 \Phi}{k(T_1 - T_0)}, \quad \text{Pr} = \frac{\mu c}{k} \\
\end{align*}

where \( \delta \) is the length of the channel, \( \psi \) Stream function, \( Q \) Volume flow rate, \( Da \) Darcy number, \( \text{Re} \) Reynolds number, \( \text{Gr} \) Grashof number, \( \theta \) dimensionless temperature, \( M^2 \) magnetic parameter, \( \beta \) dimensionless heat source/sink parameter and \( \text{Pr} \) is Prandtl number.

Substituting (9) into equations (1)-(8), we obtain the following non-dimensional equations and boundary conditions:

\begin{align*}
h(x,t) &= 1 - \phi \cos^2 \pi(x-t) \\
\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} &= 0 \\
\text{Re} \delta \left( \frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} \right) &= -\frac{\partial p}{\partial x} + \frac{1}{1 + \lambda_1} \left( \delta^3 \frac{\partial^2 u}{\partial x^2} + \delta^2 \frac{\partial u}{\partial y^2} \right) + \frac{\rho g a^2 \alpha (T - T_0)}{\mu} \theta - M^2 u - \frac{1}{Da} u \\
\text{Re} \delta^3 \left( \frac{\partial v}{\partial t} + u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} \right) &= -\frac{\partial p}{\partial y} + \delta^2 \frac{\partial^2 \frac{\partial v}{\partial x}}{\partial x^2} + \delta^2 \frac{\partial^2 \frac{\partial v}{\partial y}}{\partial y^2} - \frac{\partial^2 v}{Da} \delta^2 \\
\frac{\text{Re} \delta \text{Pr}}{(T_1 - T_0)} \left( \frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} \right) = \delta^2 \frac{\partial^2 \theta}{\partial x^2} + \frac{\partial^2 \theta}{\partial y^2} + \beta \\
\frac{1}{1 + \lambda_1} \left( \delta^2 \frac{\partial^2 u}{\partial x^2} + \delta^2 \frac{\partial u}{\partial y^2} \right) + \text{Gr} \theta - (M^2 + \frac{1}{Da}) u - \text{Re} \delta \left( \frac{\partial u}{\partial x} + u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} \right) &= (E_1 \frac{\partial^3 h}{\partial x^3} + E_2 \frac{\partial^3 h}{\partial x^2 \partial y} + E_3 \frac{\partial^3 h}{\partial x \partial y^2}) \\
\frac{\partial u}{\partial y} &= 0 \quad \text{at} \quad y = 0 \quad \text{(the regularity condition)} \\
u &= 0 \quad \text{at} \quad y = h \quad \text{(the no slip condition)} \\
v &= 0 \quad \text{at} \quad y = 0 \quad \text{(the absence of transverse velocity)} \\
\theta &= 0 \quad \text{at} \quad y = 0 \quad \text{and} \quad \theta = 1 \quad \text{at} \quad y = h
\end{align*}

4. Solution of the problem

The general solution of the governing equations (10)-(15) in the general case seems to be impossible; therefore, we shall confine the analysis under the assumption of small dimensionless wave number. It follows that \( \delta \ll 1 \). In other words, we considered the long-wavelength approximation. Along to this assumption, equations (10)-(15) become:
\( h(x,t) = 1 - \phi \cos^2 \pi (x-t) \)  

(17)

\[
\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0
\]

(18)

\[
\frac{\partial p}{\partial x} = \frac{1}{1 + \lambda_1} \frac{\partial^2 u}{\partial y^2} + Gr\theta - (M^2 + \frac{1}{Da})u
\]

(19)

\[
\frac{\partial p}{\partial y} = 0
\]

(20)

\[
\frac{\partial^2 \theta}{\partial y^2} + \beta = 0
\]

(21)

\[
\frac{1}{1 + \lambda_1} \frac{\partial^2 u}{\partial y^2} - (M^2 + \frac{1}{Da})u + Gr\theta = E_1 \frac{\partial^2 h}{\partial x^2} + E_2 \frac{\partial^2 h}{\partial t^2} + E_3 \frac{\partial h}{\partial t}
\]

(22)

Equation (20) shows that \( p \) depends on \( x \) only. The closed form solution for equations (18)-(22) with the boundary conditions Eq. (16) is given by

\[
\theta = \frac{y}{h} + \frac{\beta}{2} (hy - y^2)
\]

(23)

\[
u = B_1 e^{-\sqrt{\frac{(1+\lambda_1)\beta}{2h(1+M^2 Da)}}} + B_2 e^{-\sqrt{\frac{(1+\lambda_1)\beta}{2h(1 + M^2 Da)}}} - \frac{Da}{2h(1 + \lambda_1)(1 + M^2 Da)^2} [4h\beta Gr Da + 2h\lambda_1 Gr M^2 Da \\
+ (1 + \lambda_1 + M^2 Da) 2h\beta Gr M^2 + (1 + \lambda_1 + \lambda_1 M^2 + M^2 Da)E_3 h \pi^2 \phi - (1 + \lambda_1)(1 + M^2 Da)[4Gr \\
+ 2h^2 \beta Gr M^2 + E_1 h \pi^2 \phi \cos(4\pi(x-t)) + 16E_2 h \pi^2 \phi \sin(2\pi(x-t)) + 16E_3 h \pi^2 \phi \sin(2\pi(x-t))]]
\]

(24)

where \( B_1 \) and \( B_2 \) are constants can be determined by using the boundary conditions Eq. (16).

The corresponding Stream function \( (u = \frac{\partial \psi}{\partial y} ) \) can be obtained by integrating Eq. (24) and using the condition \( \psi = 0 \) at \( y = 0 \). It is given by

\[
\psi = \frac{\beta Gr M^2 Day^3}{3 + 3M^2 Da} + \frac{(2 + h^2 \beta)Gr Da^2}{2h(1 + M^2 Da)} - \frac{B_2 e^{-\sqrt{\frac{(1+\lambda_1)\beta}{2h(1 + M^2 Da)}}} + B_1 e^{\sqrt{\frac{(1+\lambda_1)\beta}{2h(1 + M^2 Da)}}}}{\sqrt{\frac{1}{1 + \lambda_1 M^2 + \frac{1}{Da}}} - \frac{1}{2(1 + \lambda_1)(1 + M^2 Da)^2} Day[4\beta Gr Da + (1 + \lambda_1)(1 + M^2 Da)E_3 \pi^2 \phi \\
- E_3 (1 + \lambda_1)(1 + M^2 Da)\pi^2 \phi \cos(4\pi(x-t)) \\
- 16(E_1 + E_2)(1 + \lambda_1)(1 + M^2 Da)\pi^2 \phi \sin(2\pi(x-t)))] + \frac{B_1 - B_2}{\sqrt{\frac{1}{1 + \lambda_1 M^2 + \frac{1}{Da}}}}
\]

(25)

5. Results and Discussion

In this section, the numerical and computational results are discussed for the problem of an incompressible non-Newtonian Jeffrey fluid in the channel with heat and mass transfer through the
graphical illustrations. The numerical evaluations of the analytical results and some important results are displayed graphically in Figure (2)-(20). MATHEMATICA program is used to find out numerical results and illustrations.

From Figure (2) displays the effect of rigidity parameter in the presence of stiffness \((E_2 \neq 0)\) and viscous damping force \((E_3 \neq 0)\). It is noticed that the velocity increases with increase in rigidity parameter. A similar observation is made for different values of \(E_2\) in the presence of other parameters i.e., rigidity and viscous damping force which is shown in Figure (3).

**Fig 2.** Velocity distribution for different values of \(E_1\) with \(x = 0.5, t = 0.1, E_2 = 0.5, E_3 = 0.5, Gr = 2, \lambda_1 = 0.2, \phi = 0.1, \beta = 2, Da = 0.7, M = 0.9\).

**Fig 3.** Velocity distribution for different values of \(E_2\) with \(x = 0.3, t = 0.1, E_1 = 0.7, E_3 = 0.5, Gr = 2, \lambda_1 = 0.2, \phi = 0.1, \beta = 2, Da = 0.7, M = 0.9\).
Fig 4. Velocity distribution for different values of $E_3$ with $x=0.3, t=0.1, E_1=0.7, E_2=0.5, Gr=2, \lambda_1=0.2, \phi=0.1, \beta=2, Da=0.7, M=0.9$.

From figure (4), we can see the influence of viscous damping force on velocity distribution in the presence of rigidity and stiffness. One can observe that the velocity decreases with the increase in $E_3$.

Figure (5), illustrates the effect of the parameter Grashof number $Gr$ on velocity distribution we see that $u$ increases with the increasing of $Gr$ when $y < 1$. Figures (6) and (7), it is observed that increase in Jeffrey parameter $\lambda_1$ and thermal conductivity $\beta$ results in increase of velocity distribution.

Fig 5. Velocity distribution for different values of $Gr$ with $x=0.3, t=0.1, E_1=0.7, E_2=0.5, E_3=0.5, \lambda_1=0.2, \phi=0.1, \beta=2, Da=0.7, M=0.9$. 

\[ x = 0.3, t = 0.1, E_1 = 0.7, E_2 = 0.5, \lambda_1 = 0.2, \phi = 0.1, \beta = 2, Da = 0.7, M = 0.9. \]
Fig 6. Velocity distribution for different values of $\lambda_1$ with

$x = 0.3, t = 0.1, E_i = 0.7, E_j = 0.5, Gr = 2, \phi = 0.1, \beta = 2, Da = 0.7, M = 0.9.$

Fig 7. Velocity distribution for different values of $\beta$ with

$x = 0.3, t = 0.1, E_i = 0.7, E_j = 0.5, Gr = 2, \phi = 0.1, \lambda_i = 0.2, Da = 0.7, M = 0.9.$

Fig 8. Velocity distribution for different values of $\phi$ with

$x = 0.3, t = 0.1, E_i = 0.7, E_j = 0.5, Gr = 2, M = 0.9, \lambda_i = 0.2, Da = 0.7, \beta = 2.$
Figure (8) show that velocity distribution increases with the increasing of $\beta$. Figure (9) show that velocity distribution decreases with the increasing of magnetic parameter $M$, while Figure (10) it is observed that increase in Darcy number $Da$ results in increase of velocity distribution. The variation in temperature for various values of thermal conductivity is shown in Figure (11). The temperature increases with the increase in $\beta$.The variation in temperature for various values of thermal conductivity is shown in Figure (10). The temperature increases with the increase in $\beta$.

Fig. 9. Velocity distribution for different values of $M$ with 

$$x = 0.3, t = 0.1, E_1 = 0.7, E_3 = 0.5, Gr = 2, \phi = 0.1, \lambda = 0.2, Da = 0.7, \beta = 2.$$ 

Fig. 10. Velocity distribution for different values of $Da$ with 

$$x = 0.3, t = 0.1, E_1 = 0.7, E_3 = 0.5, \lambda = 0.2, Gr = 2, \beta = 2, \phi = 0.1, M = 0.9.$$ 

Fig. 11. Velocity distribution for different values of $\beta$ with 

$$x = 0.3, t = 0.1, \phi = 0.1.$$
6. Trapping phenomenon

The formation of an internally circulating bolus of fluid by closed streamlines is called trapping and this trapped bolus is pushed ahead along with the peristaltic wave. The effects of $E_1$, $E_2$, $E_3$, $\beta$, $Gr$, $\lambda_1$, $M$ and $D_a$ on trapping can be seen through Figures (12)-(20). Fig.(12) show that the size of the trapped bolus increase with the increase in $E_1$. Fig.(13) is plotted, the effect of $E_2$ on trapping, the size of the trapped bolus increase with the increase in $E_2$. Fig.(14) show that the size of the trapped bolus decrease with the increase in $E_3$. The effect of thermal conductivity on trapping is analyzed in Figure (15). It can be concluded that the size of the trapped bolus in the left side of the channel decreases when $\beta$ increases whereas it has opposite behavior in the right hand side of the channel.

The influence of Grashof number $Gr$ on trapping is analyzed in Figure (16). It shows that the size of the left trapped bolus decreases with increase in $Gr$ whereas the size of the right trapped bolus increases with increase in $Gr$. The effect of $\lambda_1$ on trapping can be seen in Figure (17). We notice that the size of the bolus increases with increase $\lambda_1$. The effect of $\phi$ on trapping is analyzed in Figure (18). We notice that the size of the bolus increases with increase $\phi$.

Fig.12 Graph of the streamlines for four different values of $E_1$; (a) $E_1 = 0.5$, (b) $E_1 = 1.5$, and (c) $E_1 = 2$ at $t = 0.1, E_1 = 0.5, E_3 = 0.5, D_a = 0.9, M = 0.9, Gr = 2, \lambda_1 = 0.2, \phi = 0.1, \beta = 2$.

Fig.13 Graph of the streamlines for four different values of $E_2$; (a) $E_2 = 0.1$, (b) $E_2 = 0.5$, and (c) $E_2 = 1.5$ at $t = 0.1, E_1 = 0.7, E_3 = 0.5, D_a = 0.9, M = 0.9, Gr = 2, \lambda_1 = 0.2, \phi = 0.1, \beta = 2$.
Fig. 14 Graph of the streamlines for four different values of $E_i$; (a) $E_i = 0.5$, (b) $E_i = 1.5$, and (c) $E_i = 2$ at $t = 0.1, E_1 = 0.7, E_2 = 0.5, Da = 0.9, M = 0.9, Gr = 2, \lambda_i = 0.2, \phi = 0.1, \lambda = 2$.

Fig. 15 Graph of the streamlines for four different values of $\beta$; (a) $\beta = 0$, (b) $\beta = 4$, and (c) $\beta = 6$ at $t = 0.1, E_1 = 0.7, E_2 = 0.5, Da = 0.9, M = 0.9, Gr = 2, \phi = 0.1, \lambda_i = 0.2$.

Fig. 16 Graph of the streamlines for four different values of $Gr$; (a) $Gr = 0$, (b) $Gr = 2$, and (c) $Gr = 4$ at $t = 0.1, E_1 = 0.7, E_2 = 0.5, E_3 = 0.5, Da = 0.9, M = 0.9, \lambda_i = 0.2, \phi = 0.1, \beta = 2$. 

96
Fig. 17 Graph of the streamlines for four different values of $\lambda_1$: (a) $\lambda_1 = 0$, (b) $\lambda_1 = 0.2$, and (c) $\lambda_1 = 0.6$ at $t = 0.1, E_1 = 0.7, E_2 = 0.5, Da = 0.9, M = 0.9, Gr = 2, \phi = 0.1, \beta = 2$. 

Fig. 18 Graph of the streamlines for four different values of $\phi$: (a) $\phi = 0.05$, (b) $\phi = 0.1$, and (c) $\phi = 0.15$ at $t = 0.1, E_1 = 0.7, E_2 = 0.5, Da = 0.9, M = 0.9, Gr = 2, \lambda_1 = 0.2, \beta = 2$.

The influence of Darcy number $Da$ on trapping is analyzed in Figure (19). It shows that the size of the left trapped bolus decreases with increase in $Da$ where as the size of the right trapped bolus increases with increase in $Da$. And Figure (20) show that influence of $M$ on trapping. It shows that the size of the left trapped bolus increases with increase in $M$ where as the size of the right trapped bolus decreases with increase in $M$. 
7- Concluding remarks

The present study deals with the combined effect of wall properties and heat transfer on the peristaltic transport of a Jeffrey fluid through porous medium channel. We obtained the analytical solution of the problem under long wavelength and low Reynolds number assumptions. The results are analyzed for different values of pertinent parameters namely Grashof number, Darcy number, thermal conductivity, rigidity, stiffness, magnet and viscous damping forces of the channel wall. Some of the interesting findings are:

1. The axial velocity increases with the increase in $E_1$, $E_2$, $\beta$, $Gr$, $Da$, $\phi$ and $\lambda_1$. Further, the axial velocity decreases with increase in $E_3$ and $M$. and attains its maximum height at $y = 0$, as specified by the boundary conditions.
2. The volume of the trapped bolus increases with increase in $E_1$, $E_2$ and $\phi$. Moreover, more trapped bolus appears with increase in $E_1$, $E_2$ and $\phi$.
3. The volume of the trapped bolus decreases with increase in $E_3$.
4. The volume of the left trapped bolus decreases with increase in $\beta$, $Gr$, $Da$, where as it has opposite behavior in the right hand side of the channel. And inversion with respect to $\lambda_1$ and $M$.
5. The coefficient of temperature increases with increasing values of thermal conductivity.
