## ABSTRACT

The object of this paper is to obtain a common random fixed point theorem for two continuous random operators defined on a non empty closed subset of a separable Hilbert space for integral type mapping.

**Key words:** common fixed point, rational expression, hilbert space random variable

## 1. INTRODUCTION AND PRELIMINARIES

Impact of fixed point theory in different branches of mathematics and its applications is immense. The first result on fixed points for Contractive type mapping was the much celebrated Banach's contraction principle by S. Banach [9] in 1922. In the general setting of complete metric space, this theorem runs as the follows,

**Theorem 1.1** (Banach's contraction principle) Let  $(X, d)$  be a complete metric space,  $c \in (0, 1)$  and  $f: X \rightarrow X$  be a mapping such that for each  $x, y \in X$ ,  $d(fx, fy) \leq cd(x, y)$ . Then  $f$  has a unique fixed point  $a \in X$ , such that for each  $x \in X$ ,  $\lim_{n \rightarrow \infty} f^n x = a$ .

After the classical result, Kannan [7] gave a subsequently new contractive mapping to prove the fixed point theorem. Since then a number of mathematicians have been worked on fixed point theory dealing with mappings satisfying various type of contractive conditions.

In 2002, A. Branciari [1] analyzed the existence of fixed point for mapping  $f$  defined on a complete metric space  $(X, d)$  satisfying a general contractive condition of integral type.

**Theorem 1.2 (Branciari)** Let  $(X, d)$  be a complete metric space,  $c \in (0, 1)$  and let  $f: X \rightarrow X$  be a mapping such that for each  $x, y \in X$ ,

Where  $\int_0^d(fx, fy) \xi(t) dt \leq \int_0^{d(x, y)} \xi(t) dt$   $\xi: [0, +\infty) \rightarrow [0, +\infty)$  is a Lebesgue integrable mapping which is summable on each compact subset of  $[0, +\infty)$ , non negative, and such that for each  $\epsilon > 0$ ,  $\int_0^\epsilon \xi(t) dt < \epsilon$ , then  $f$  has a unique fixed point  $a \in X$  such that for each  $x \in X$ ,

$\lim_{n \rightarrow \infty} f^n x = a$ . After the paper of Branciari, a lot of a research works have been carried out on generalizing contractive conditions of integral type for different contractive mappings satisfying various known properties. A fine work has been done by Rhoades [2] extending the result of Branciari by replacing the condition [1.2] by the following

The aim of  $\int_0^{d(fx, fy)} \xi(t) dt \leq \int_0^{\max\left\{d(x, y), d(x, fx), d(y, fy), \frac{d(x, fy) + d(y, fx)}{2}\right\}} \xi(t) dt$  this

paper is to generalize some mixed type of contractive conditions to the mapping and then a pair of mappings satisfying general contractive mappings such as Kannan type [7], Chatrterjee type [8], Zamfirescu type [11], etc.

In 2010, the study of random fixed points has attracted much attention. Some of the recent literatures in random fixed point may be noted in Rhoades [3], and Binayak S. Choudhary [4]. In this paper, we construct a sequence of measurable functions and consider its convergence to the common unique random fixed point of four continuous random operators defined on a non-empty closed subset of a separable Hilbert space. For the purpose of obtaining the random fixed point of the four continuous random operators. We have used a rational inequality (from B. Fisher [5] and S.S. Pagey [10]) and the parallelogram law. Throughout this paper,  $(\Omega, \Sigma)$  denotes a measurable space consisting of a set  $\Omega$  and sigma algebra  $\Sigma$  of subsets of  $\Omega$ ,  $H$  stands for a separable Hilbert space and  $C$  is a nonempty closed subset of  $H$ .

**Definition 1.3.** A function  $f: \Omega \rightarrow C$  is said to be measurable if

$$f^{-1}(B \cap C) \in \Sigma \text{ for every Borel subset } B \text{ of } H.$$

**Definition 1.4.** A function  $F: \Omega \times C \rightarrow C$  is said to be a random operator if  $F(., x): \Omega \rightarrow C$  is measurable for every  $x \in C$

**Definition 1.5.** A measurable  $g: \Omega \rightarrow C$  is said to be a random fixed point of the random operator  $F: \Omega \times C \rightarrow C$  if  $F(t, g(t)) = g(t)$  for all  $t \in \Omega$

**Definition 1.6.** A random operator  $F: \Omega \times C \rightarrow C$  is said to be continuous if for fixed  $t \in \Omega$ ,  $F(t, .): C \rightarrow C$  is continuous.

**Condition (A).** Two mappings,  $T, S: C \rightarrow C$ , where  $C$  is a non-empty closed subset of a Hilbert space  $H$ , is said to satisfy condition (A) if

$$\|S_x - T_y\| \leq a \int_0^{\frac{\|y-Ty\|^2 [1+\|x-Sx\|^2]}{1+\|x-y\|^2}} \xi(t) dt + b \int_0^{\|x-Sx\|^2 + \|y-Ty\|^2} \xi(t) dt$$

with  $a, b \geq 0, a + b < \frac{1}{2}$

where  $x, y \in C$   $\xi: R^+ \rightarrow R^+$  is a lebesgue- integrable mapping which is summable on each compact

subset of  $R^+$ , non negative, and such that for each  $\epsilon > 0, \int_0^\epsilon \xi(t) dt < \epsilon$ .

**2. MAIN RESULTS**

**Theorem 2.1.** Let  $C$  be a non-empty closed subset of a separable Hilbert space  $H$ . Let  $S$  and  $T$  be two continuous random operators defined on  $C$  such that for,  $t \in \Omega$   $T(t, .), S(t, .): C \rightarrow C$  satisfy condition (A) then  $S$  and  $T$  have unique common random fixed point.

**Proof:** We define a sequence of functions  $\{g_n\}$  as  $g_0: \Omega \rightarrow C$  is arbitrary measurable function for  $t \in \Omega$ , and

$$n = 0, 1, 2, 3, \dots \quad g_{2n+1}(t) = S(t, g_{2n}(t)), g_{2n+2}(t) = T(t, g_{2n+1}(t)) \dots \dots \dots (1)$$

If  $g_{2n}(t) = g_{2n+1}(t) = g_{2n+2}(t)$  for  $t \in \Omega$  for some  $n$  then we see that  $\{g_{2n}\}$  is a random fixed point of  $S$  and  $T$ . Therefore, we suppose that no two consecutive terms of sequence  $\{g_n\}$  are equal.

**Common random fixed point theorem:** Now Consider for  $t \in \Omega$

$$\begin{aligned}
 \int_0^{\infty} \|g_{2n+1}(t) - g_{2n+2}(t)\|^2 \xi(\lambda) d\lambda &\leq \int_0^{\infty} \|S(t, g_{2n}(t)) - T(t, g_{2n+1}(t))\|^2 \xi(\lambda) d\lambda \\
 &\leq a \int_0^{\infty} \frac{\|g_{2n+1}(t) - T(t, g_{2n+1}(t))\|^2 [1 + \|g_{2n}(t) - S(t, g_{2n}(t))\|^2]}{1 + \|g_{2n}(t) - g_{2n+1}(t)\|^2} \xi(\lambda) d\lambda \\
 &\quad + b \int_0^{\infty} [\|g_{2n}(t) - S(t, g_{2n}(t))\|^2 + \|g_{2n+1}(t) - T(t, g_{2n+1}(t))\|^2] \xi(\lambda) d\lambda \\
 &= a \int_0^{\infty} \frac{\|g_{2n+1}(t) - g_{2n+2}(t)\|^2 [1 + \|g_{2n}(t) - g_{2n+1}(t)\|^2]}{1 + \|g_{2n}(t) - g_{2n+1}(t)\|^2} \xi(\lambda) d\lambda \\
 &\quad + b \int_0^{\infty} [\|g_{2n}(t) - g_{2n+1}(t)\|^2 + \|g_{2n+1}(t) - g_{2n+2}(t)\|^2] \xi(\lambda) d\lambda \\
 &= (a + b) \int_0^{\infty} [\|g_{2n+1}(t) - g_{2n+2}(t)\|^2 + b \|g_{2n}(t) - g_{2n+1}(t)\|^2] \xi(\lambda) d\lambda \\
 \Rightarrow [1 - (a + b)] \int_0^{\infty} \|g_{2n+1}(t) - g_{2n+2}(t)\|^2 \xi(\lambda) d\lambda &\leq b \int_0^{\infty} \|g_{2n}(t) - g_{2n+1}(t)\|^2 \xi(\lambda) d\lambda \\
 \Rightarrow \int_0^{\infty} \|g_{2n+1}(t) - g_{2n+2}(t)\|^2 \xi(\lambda) d\lambda &\leq \frac{b}{1 - (a + b)} \int_0^{\infty} \|g_{2n}(t) - g_{2n+1}(t)\|^2 \xi(\lambda) d\lambda \\
 &\Rightarrow \int_0^{\infty} \|g_{2n+1}(t) - g_{2n+2}(t)\|^2 \xi(\lambda) d\lambda \leq k \int_0^{\infty} \|g_{2n}(t) - g_{2n+1}(t)\|^2 \xi(\lambda) d\lambda \\
 \text{where } k &= \left( \frac{b}{1 - (a + b)} \right)^{\frac{1}{2}} < \frac{1}{2}
 \end{aligned}$$

In Integral

$$\begin{aligned}
 \int_0^{\infty} \|g_n(t) - g_{n+1}(t)\| \xi(\lambda) d\lambda &\leq k \int_0^{\infty} \|g_{n-1}(t) - g_n(t)\| \xi(\lambda) d\lambda \\
 \int_0^{\infty} \|g_n(t) - g_{n+1}(t)\| \xi(\lambda) d\lambda &\leq k^n \int_0^{\infty} \|g_{n-1}(t) - g_n(t)\| \xi(\lambda) d\lambda \\
 &\text{for } t \in \Omega \text{ ----- (2)}
 \end{aligned}$$

Now, we shall prove that for  $t \in \Omega$ ,  $g_n(t)$  is a Cauchy sequence.  
 for Common random fixed point theorem every positive integer p,  
 We have,

$$\int_0^1 \|g_n(t) - g_{n+1}(t) + g_{n+1}(t) - g_{n+2}(t) + g_{n+2}(t) + \dots + g_{n+p-1}(t) - g_{n+p}(t)\| \xi(\lambda) d\lambda$$

$$\leq \int_0^1 \|g_n(t) - g_{n+1}(t)\| + \|g_{n+1}(t) - g_{n+2}(t)\| + \dots + \|g_{n+p-1}(t) - g_{n+p}(t)\| \xi(\lambda) d\lambda$$

$$\leq [k^n + k^{n+1} + \dots + k^{n+p-1}] \int_0^1 \|g_0(t) - g_1(t)\| \xi(\lambda) d\lambda$$

$$= k^n [1 + k + k^2 + \dots + k^{p-1}] \int_0^1 \|g_0(t) - g_1(t)\| \xi(\lambda) d\lambda$$

$$\leq \frac{k^n}{(1-k)} \int_0^1 \|g_0(t) - g_1(t)\| \xi(\lambda) d\lambda$$

$$\Rightarrow \lim_{n \rightarrow \infty} \int_0^1 \|g_n(t) - g_{n+p}(t)\| \xi(\lambda) d\lambda = 0 \text{ for } t \in \Omega$$

It follows that for,  $\{g_n(t)\}$  is a Cauchy sequence and hence is convergent in closed subset C of Hilbert space H.

$$\lim_{n \rightarrow \infty} \int_0^1 \xi(\lambda) d\lambda = g(t) \text{ For } t \in \Omega \text{-----} (3)$$

**Existence of random fixed point:** Consider for  $t \in \Omega$

$$\int_0^1 \|T(t, g(t)) - g(t)\|^2 \xi(\lambda) d\lambda$$

$$= \int_0^1 \|T(t, g(t)) - g_{2n+1}(t) + g_{2n+1}(t) - g(t)\|^2 \xi(\lambda) d\lambda$$

$$\leq 2 \int_0^1 \|T(t, g(t)) - g_{2n+1}(t)\|^2 \xi(\lambda) d\lambda + 2 \int_0^1 \|g_{2n+1}(t) - g(t)\|^2 \xi(\lambda) d\lambda$$

[By parallelogram law  $\|x + y\|^2 \leq \|x\|^2 + \|y\|^2$ ]

As  $\{g_{2n+1}(t)\}$  and  $\{g_{2n+2}(t)\}$  are subsequences of  $\{g_n(t)\}$   
 as  $n \rightarrow \infty$ ,  $\{g_{2n+1}(t)\} \rightarrow \{g(t)\}$  and  $\{g_{2n+2}(t)\} \rightarrow \{g(t)\}$

Therefore,

$$\begin{aligned}
 & \int_0^{\|g(t)-T(t,g(t))\|^2} \xi(\lambda) d\lambda \leq 2 \int_0^{\|g(t)-g(t)\|^2} \xi(\lambda) d\lambda \\
 & + 2a \int_0^{\frac{\|g(t)-T(t,g(t))\|^2 [1+\|g(t)-g(t)\|^2]}{[1+\|g(t)-g(t)\|^2]}} \xi(\lambda) d\lambda \\
 & + 2b \int_0^{[\|g(t)-g(t)\|^2 + \|g(t)-T(t,g(t))\|^2]} \xi(\lambda) d\lambda \\
 & \leq 2(a+b) \int_0^{\|g(t)-T(t,g(t))\|^2} \xi(\lambda) d\lambda \\
 & \Rightarrow [1 - 2(a+b)] \int_0^{\|g(t)-T(t,g(t))\|^2} \xi(\lambda) d\lambda \leq 0 \\
 & \Rightarrow \int_0^{\|g(t)-T(t,g(t))\|^2} \xi(\lambda) d\lambda = 0 \quad (as\ 2(a+b) < 1) \\
 & \Rightarrow \int_0^{T(t,g(t))} \xi(\lambda) d\lambda = \int_0^{g(t)} \xi(\lambda) d\lambda \quad \forall t \in \Omega
 \end{aligned}
 \tag{4}$$

**Common unique random fixed point theorem**

In an exactly similar way we can prove that for all  $t \in \Omega$

$$\int_0^{S(t,g(t))} \xi(\lambda) d\lambda = \int_0^{g(t)} \xi(\lambda) d\lambda \tag{5}$$

Again, if  $A: \Omega \times C \rightarrow C$  is a continuous random operator on a non-empty subset  $C$  of a separable Hilbert space  $H$ , then for any measurable function  $f: \Omega \rightarrow C$ , the function  $h(t) = A(t, f(t))$  is also measurable [3].

It follows from the construction of  $\{g_n\}$  (by (1)) and the above consideration that  $\{g_n\}$  is a sequence of measurable functions. From (3), it follows that  $g$  is also a measurable function. This fact along with (4) and (5) shows that  $g: \Omega \rightarrow C$  is a common random fixed point of  $S$  and  $T$ .

**Uniqueness-**

Let  $h: \Omega \rightarrow C$  be another random fixed point common to  $S$  and  $T$ , that is, for  $t \in \Omega$

$$\begin{aligned}
 \int_0^{T(t,h(t))} \xi(\lambda) d\lambda &= \int_0^{h(t)} \xi(\lambda) d\lambda, \int_0^{S(t,h(t))} \xi(\lambda) d\lambda = \int_0^{h(t)} \xi(\lambda) d\lambda \\
 \int_0^{S(t,h(t))} \xi(\lambda) d\lambda &= \int_0^{h(t)} \xi(\lambda) d\lambda
 \end{aligned}$$

Then for  $t \in \Omega$ ,

$$\begin{aligned}
 & \int_0^1 \|g(t) - h(t)\|^2 \xi(\lambda) d\lambda = 2 \int_0^1 \|S(t, g(t)) - T(t, h(t))\|^2 \xi(\lambda) d\lambda \\
 & = a \int_0^1 \frac{\|h(t) - T(t, h(t))\|^2 [1 + \|g(t) - S(t, g(t))\|^2]}{[1 + \|g(t) - h(t)\|^2]} \xi(\lambda) d\lambda \\
 & + b \int_0^1 [\|g(t) - S(t, g(t))\|^2 + \|h(t) - T(t, h(t))\|^2] \xi(\lambda) d\lambda \\
 & = a \int_0^1 \frac{\|h(t) - T(t, h(t))\|^2 [1 + \|g(t) - S(t, g(t))\|^2]}{[1 + \|g(t) - h(t)\|^2]} \xi(\lambda) d\lambda \\
 & + b \int_0^1 [\|g(t) - S(t, g(t))\|^2 + \|h(t) - T(t, h(t))\|^2] \xi(\lambda) d\lambda \\
 & \Rightarrow \int_0^1 \|g(t) - h(t)\|^2 \xi(\lambda) d\lambda \leq 0 \\
 & \Rightarrow \int_0^1 g(t) \xi(\lambda) d\lambda = \int_0^1 h(t) \xi(\lambda) d\lambda \quad \forall t \in \Omega \\
 & \Rightarrow g(t) = h(t) \quad \forall t \in \Omega
 \end{aligned}$$

This completes proof of theorem (2.1).

**ACKNOWLEDGEMENTS:** The authors are thankful to Prof. B.E.Rhoades [Indiana University, Bloomington, USA] for providing us necessary Literature of fixed point theory.

## CALL FOR PAPERS

The IISTE is currently hosting more than 30 peer-reviewed academic journals and collaborating with academic institutions around the world. There's no deadline for submission. **Prospective authors of IISTE journals can find the submission instruction on the following page:** <http://www.iiste.org/Journals/>

The IISTE editorial team promises to review and publish all the qualified submissions in a **fast** manner. All the journals articles are available online to the readers all over the world without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself. Printed version of the journals is also available upon request of readers and authors.
